What happens to my recycling?

When you place a recyclable item in the bin it is collected by Veolia, our recycling and waste contractor, and transported to a sorting facility where it will be processed and separated into similar items. Each item is then sent to other facilities equipped to reprocess that specific material.

Veolia's practices meet and exceed the legal requirements for recycling. Their dedicated team audits, visits and rigorously monitors all outlets for recycling commodities to ensure the highest standards are met. Veolia also works closely with the Environment Agency to reduce waste crime, ensuring that every step of the recycling chain is accountable and efficient. You can be sure that when you recycle, it will go to the right place.

For specific end destinations, please see the table below, as locations change depending on markets. The information below is a snapshot of destinations from January to September 2024. Veolia only exports recycling abroad when we do not have the capacity or available facilities in the UK.

Exporting waste is not always a bad thing. It is certainly not acceptable if it doesn't go to the right location to get value back, but Veolia ensures that export entails a valuable material going to a location that makes the most of it. For example, the UK imports a large proportion of its food, and therefore we need to send some plastic pellets to the people packaging that food. Export is part of the global economy: **Veolia's job is to make sure it's done correctly and invest in UK infrastructure where it makes sense**.
